

INTRODUCING

Bella Blankets™

Protective Coverlets for Mammography

While the typical annual mammography exam lasts just 15 minutes, it is an experience of heightened anxiety for most women. After all, every woman knows someone with breast cancer and is understandably anxious to learn the results of their own exam.

Beekley introduces Bella Blankets.

These protective coverlets for mammography are designed to remove the chill from the bucky / receptor plate helping patients to feel more at ease and drastically minimizing the complaints that the bucky is cold.

Today, most imaging centers are trying to enhance the atmosphere and make the mammogram as comfortable as possible to reduce patient stress so there is a good chance they will return every year for this important examination.

Bella Blankets are designed to protect the most delicate skin. Patients such as the elderly with thin skin, women who have cuts in the inframammary fold or those who require a second image after a needle localization procedure will especially benefit from the coverlets.

You as the Technologist will also benefit from Bella Blankets as it may help with positioning for patients that are small breasted or to immobilize perspiring breasts. Furthermore, the elegant floral design may help calm the tense patient resulting in better positioning.

The one time use, disposable Bella Blanket offers women peace of mind that your imaging center provides a sanitary and caring environment.

Provide the extra care to accommodate your patients and distinguish your breast center in your community.

Bella Blankets are FDA approved.

Bella Blankets are designed to be used with both digital and analog units.

Bella Blankets cover both the top and front of the bucky / receptor plate to provide added protection for the breast and inframammary fold.
